every x has one partner

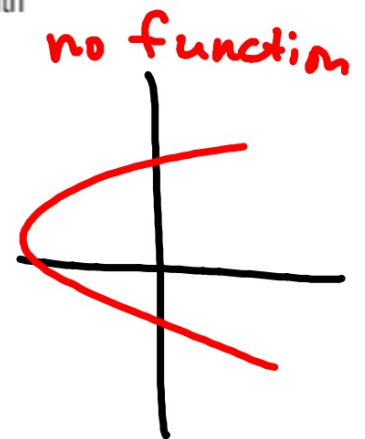

Every input has exactly one output!

KeyConcept Function

Words

A function is a relation in which each element of the domain is paired with *exactly one* element of the range.

Examples

b.

Domain x	1	3	5	1
Range y	4	2	4	-4

Guided Practice

1. $\{(2, 1), (3, -2), (3, 1), (2, -2)\}$ $(2, 2)$

$$y = mx + B$$

Example 3 Equations as Functions

Determine whether $-3x + y = 8$ is a function.

$$\begin{array}{r} +3x \\ +3x \end{array}$$

$$\frac{3}{1}$$

$$-\frac{3}{1}$$

$$y = 3x + 8$$

Function

► **Guided Practice** Determine whether each relation is a function.

$$3A. \frac{4x}{4} = \frac{8}{4}$$

$$x = 2$$

no function

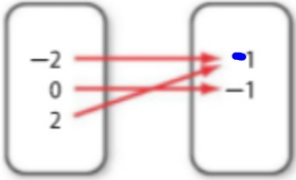

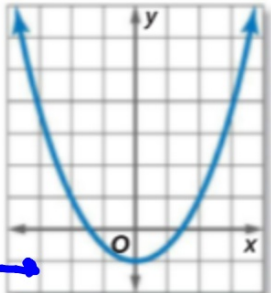

$$3B. 4x = y + 8$$

$$\begin{aligned} & -8 \quad -8 \\ 4x + 8 &= y \\ \frac{4x + 8}{4} &= \frac{y}{4} \\ x + 2 &= \frac{y}{4} \\ \Rightarrow & \end{aligned}$$

function

Concept Summary Representations of a Function

Table	Mapping	Equation	Graph								
<p><i>f</i></p> <table border="1"><thead><tr><th>x</th><th>y</th></tr></thead><tbody><tr><td>-2</td><td>1</td></tr><tr><td>0</td><td>-1</td></tr><tr><td>2</td><td>1</td></tr></tbody></table>	x	y	-2	1	0	-1	2	1	<p><i>f</i></p> <p>Domain</p> <p>Range</p> 	<p><i>graph</i> <i>lim</i></p> <p>$f(x) = x^2 - 1$</p>	<p><i>f</i></p> 
x	y										
-2	1										
0	-1										
2	1

2 Find Function Values Equations that are functions can be written in a form called **function notation**. For example, consider $y = 3x - 8$.

Equation
 $y = 3x - 8$

Function Notation
 $f(x) = 3x - 8$

In a function, x represents the elements of the domain, and $f(x)$ represents the elements of the range. The graph of $f(x)$ is the graph of the equation $y = f(x)$. Suppose you want to find the value in the range that corresponds to the element 5 in the domain. This is written $f(5)$ and is read *f of 5*. The value $f(5)$ is found by substituting 5 for x in the equation.

Example 1 Function Values

For $f(x) = -4x + 7$, find each value.

$$\begin{aligned} f(3) &= -4 \cdot 3 + 7 \\ &= -12 + 7 \\ &= -5 \end{aligned}$$

$$f(5) = -4 \cdot 5 + 7 = -13$$

$$\begin{aligned} f(10) &= -4(10) + 7 \\ &= -40 + 7 \\ &= -33 \end{aligned}$$

$$f(1) = -4 \cdot 1 + 7$$

$$f(3) =$$

Guided Practice

For $f(x) = 2x - 3$, find each value.

$$\begin{aligned} 4A. f(1) &= 2 \cdot 1 - 3 \\ &= 2 + -3 \\ &= -1 \end{aligned}$$

$$\begin{aligned} 4C. f(-2) &= 2(-2) - 3 \\ &= 4 + -3 \\ &= -7 \end{aligned}$$

$$-4 + 3$$

$$4B. 6 - f(5)$$

WB 1.7
Skills

$$4D. f(-1) + f(2)$$

$$\begin{aligned} f(-6) &= 2(-6) - 3 \\ &= -12 + -3 \\ &= -15 \end{aligned}$$

$$\begin{aligned} f(-4) &= 2(-4) - 3 \\ &= -8 + -3 \\ &= -11 \end{aligned}$$
